Abstracts

The global All Electric SUV market size is expected to reach \$ 4397 million by 2032, rising at a market growth of 13.3% CAGR during the forecast period (2026-2032). In 2024, global All Electric SUV production reached approximately 32,367 units with an average global market price of around US\$49,000 per unit. Single-line annual production capacity averages 3,200 units with a gross margin of approximately 18%~20%. The upstream core of the All Electric SUV industry is concentrated in the battery, motor, and electronic control system?collectively known as the 'three electrics'?which account for approximately 40-50% of total vehicle costs. Among these, the power battery (particularly high-energy-density ternary lithium and lithium iron phosphate batteries) is the absolute focus, with the supply and cost of raw materials (such as lithium, cobalt, and nickel) forming a critical bottleneck. In terms of downstream demand, the personal consumer market dominates, representing about 85-90% of total sales, while commercial operations (such as ride-hailing, leasing, and corporate fleets) account for approximately 10-15%.

The core demands and business opportunities for All Electric SUVs can be summarized into four key points: First, the anxiety over range and charging drives opportunities for battery technology innovation (such as solid-state batteries) and the deployment of ultra-fast charging networks. Second, the intelligent experience (including advanced driver-assistance systems and smart cockpits) has become a new core purchasing driver and a source of profitability for software services. Third, platform-based vehicle manufacturing enables optimization of R&D costs and opens up space for personalized, modular product definition. Fourth, ecosystem expansion based on the vehicle's global electronic and electrical architecture, such as V2G (vehicle-to-grid) and data value-added services, fosters innovative business models in the aftermarket.'
