According to our (Global Info Research) latest study, the global All Iron Flow Battery market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Iron-based liquid flow batteries are energy storage batteries that can convert electrical energy into chemical energy for storage, and then convert chemical energy into electrical energy for release when needed. Iron-based liquid flow batteries balance the load of the power grid by storing electrical energy, and release the stored electrical energy during peak energy demand periods, thereby providing a stable power supply for the power system. Therefore, iron-based liquid flow batteries play an important role in achieving a smooth power supply from renewable energy and improving the stability of the power grid. The price of an all-iron liquid flow battery will be 1/3 of that of an all-vanadium liquid flow battery, which can significantly reduce the cost of current liquid flow batteries. The all-iron liquid flow battery uses neutral ferrous chloride as the active material. It is low-cost, environmentally friendly, has high energy density, and has obvious resource advantages. It can meet the needs of large-scale, long-term energy storage at the future grid level and is beginning to stand out.
