Abstracts

The global Allyllithium market size is expected to reach \$ 250 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

Allyllithium is a highly reactive organolithium compound with the chemical formula $C^?H^?Li$, consisting of an allyl group ($CH^?=CH^?CH^??$) bonded to lithium. It is widely used as a strong base, nucleophile, and synthetic intermediate in organic chemistry for carbon-carbon bond formation, pharmaceutical synthesis, agrochemicals, specialty chemicals, and advanced materials production. Industrially, allyllithium is typically manufactured through the reaction of allyl halides (primarily allyl chloride or allyl bromide) with metallic lithium in hydrocarbon or ether solvents under strictly controlled anhydrous and inert conditions. The supply chain begins with upstream raw materials including petrochemical-derived propylene, which is converted into allyl chloride or related allyl compounds, and lithium metal produced from lithium carbonate or lithium chloride. Midstream activities involve organolithium reagent synthesis, purification, packaging, and handling using specialized facilities designed for pyrophoric and moisture-sensitive chemicals. Downstream, allyllithium is consumed by pharmaceutical manufacturers, fine chemical producers, agrochemical companies, contract development and manufacturing organizations (CDMOs), research institutions, and specialty material manufacturers that utilize the reagent in high-value organic synthesis processes. In 2025, global Allyllithium output was about 12,000 tons with 15,000 tons of capacity, average prices of USD 10,000-25,000 per ton, and gross margins around 37%.

This report studies the global Allyllithium production, demand, key manufacturers, and key regions.
