## Abstracts

The global AlMgSc Alloy Powder for Additive Manufacturing market size is expected to reach \$ 39.53 million by 2032, rising at a market growth of 5.9% CAGR during the forecast period (2026-2032).

In 2025, global AlMgSc Alloy Powder for Additive Manufacturing production reached approximately 470 tons, with an average global market price of around US\$55 per kilogram. Aluminum magnesium scandium alloy (AlMgSc) is a new type of high-performance alloy material made of metal aluminum as the base material, metal magnesium as the main added element, and a trace amount of metal scandium. AlMgSc alloy powder is usually used as raw material for additive manufacturing and is ultimately used in the fields of automotive, new energy, ships, aviation, aerospace, etc. The global market for AlMgSc alloy powder for additive manufacturing is driven by the demand for lightweight, high-strength components in aerospace and high-end manufacturing, and is currently in a technology-driven development stage. Its development trends are closely focused on material performance breakthroughs and process innovation; for instance, composite manufacturing processes can significantly enhance the strength of this alloy, while cutting-edge research is exploring new functionalities such as self-healing. Growth opportunities arise from the continuously increasing demand for advanced lightweight materials in sectors like electric vehicles and low-altitude economy. Additionally, achieving localized production and controllable preparation of high-quality specialized powders represents a significant market direction. However, the industry faces notable obstacles: the scarcity of the core raw material, scandium, results in a fragile and costly supply chain, limiting large-scale application. Furthermore, the powder must meet extremely high requirements for cleanliness, sphericity, and compositional consistency, posing severe challenges to production processes and quality control.
