Abstracts

The global Along-Track Scanner market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

An along-track scanner is a device for obtaining images with spectroscopic sensors. The scanners are regularly used for passive remote sensing from space, and in spectral analysis on production lines, for example with near-infrared spectroscopy used to identify contaminated food and feed. The moving scanner line in a traditional photocopier (or a scanner or facsimile machine) is also a familiar, everyday example of a push broom scanner. Along-track scanners and the whisk broom scanners variant (also known as across-track scanners) are often contrasted with staring arrays (such as in a digital camera), which image objects without scanning.

This report studies the global Along-Track Scanner production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Along-Track Scanner, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
