Abstracts

Severe deficiency of alpha-1 antitrypsin (AAT) can cause early-onset emphysema and several liver diseases, including cirrhosis, neonatal hepatitis and hepatocellular carcinoma.

Scope of the Report:

This report focuses on the Alpha 1 Antitrypsin Deficiency Treatment in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

The discovery of the structure and function of the AAT protein and the subsequent isolation and purification thereof have made possible alternative therapies aimed at preventing the progression of related pulmonary diseases (so-called "additional therapies"). The isolation of this gene and the advancement of gene therapy have further increased the possibility of specific treatment. Most specific treatments for AAT deficiency aim to increase plasma AAT levels (and thus elevated AAT concentrations in the interstitial lung) above the protection threshold. Other experimental therapeutic approaches attempt to interfere with the production of abnormal AAT proteins or to inhibit the polymerization of abnormal AAT proteins and to promote the secretion of AAT from hepatocytes. For patients with end-stage lung disease or liver disease, organ transplantation is another treatment option.

Currently, the most direct and effective way to increase AAT levels in plasma and interstitial lung is by intravenous infusion of pooled alpha-1 antitrypsin (pAAT).

The worldwide market for Alpha 1 Antitrypsin Deficiency Treatment is expected to grow at a CAGR of roughly 9.0% over the next five years, will reach 1980 million US\$ in

2023, from 1190 million US\$ in 2017, according to a new GIR (Global Info Research) study.
