According to our (Global Info Research) latest study, the global Alternative Protein New Fermentation market size was valued at US\$ 123 million in 2024 and is forecast to a readjusted size of USD 195 million by 2031 with a CAGR of 6.9% during review period.

The core target product of novel fermentation is the microbial cell itself or its metabolites. The new fermentation technology can be further divided into biomass fermentation and precision fermentation according to whether the target product is the main body of microorganisms or a specific part of microbial cells.

With the growing emphasis on sustainable foods and healthy diets, the emerging field of alternative protein new fermentation technologies is gaining significant traction. Concerns over the environmental and ethical issues associated with traditional animal husbandry and large-scale meat production have spurred consumer interest in seeking more sustainable and resource-efficient sources of protein. Novel fermentation techniques utilize microbial activity to convert organic waste into high-quality protein, reducing environmental impact while offering nutritionally-rich food options. In Asia, traditional ingredients like legumes and algae are being revitalized through fermentation processes to create protein alternatives that mimic the texture of meat, catering to the preferences of meat consumers. This trend has garnered positive responses in the market, with investors expressing optimism about the future prospects of this sector.
