According to our (Global Info Research) latest study, the global Alumina and Bauxite market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Bauxite (Bauxite) actually refers to the general name of ores that can be used industrially, consisting mainly of gibbsite and monohydrated silica. Bauxite is the best raw material for the production of metallic aluminum, and it is also the most important application field. The amount of bauxite is more than 90% of the total output of bauxite in the world. Aluminum oxide, chemical formula Al_2O_3 . It is a high hardness compound with a melting point of $2054^{\circ}C$ and a boiling point of $2980^{\circ}C$. It can ionize ion crystals at high temperatures and is often used in the manufacture of refractory materials.

The bauxite and alumina market can be segmented as metallurgical and non metallurgical products. A metallurgical segment includes the bauxite and alumina used for extraction of aluminum and is the largest product segment. Spot volumes in the alumina market are not huge. This structure inevitably results in a limited, though not insignificant, number of cargoes which can feed into the index. Unlike the alumina market, the bauxite industry is yet to reach a consensus on pricing mechanisms, beyond long-term, fixed-price contracts. Further upstream in the aluminium supply chain, spot market volumes are thin and still reflect a minority of the sales book that is not captured by integrated activities or long-term contracts. As such, bauxite looks several years behind the alumina market in terms of its maturity, but market players nonetheless expect it to develop along the same lines.
