According to our (Global Info Research) latest study, the global Aluminum Alloy Battery Pack Shell market size was valued at US$ 1212 million in 2024 and is forecast to a readjusted size of USD 2429 million by 2031 with a CAGR of 10.4% during review period.

Aluminum alloy battery pack shell is an aluminum alloy shell used to protect battery packs, especially in electric vehicles (EVs) or energy storage systems. The main function of the battery pack shell is to provide physical protection, heat dissipation, and isolation for the battery cells, ensuring that the battery operates in a safe working environment, while also providing structural support. Aluminum alloy, as a shell material, is widely used due to its unique advantages. With the development of new energy vehicles, especially pure electric vehicles, higher requirements have been put forward for the lightweight development of automobiles. The urgent need for lightweight development of energy vehicles has given rise to the application of aluminum alloy battery casings. Various manufacturers and battery pack manufacturers in the industry are researching and developing new lightweight solutions for battery casings. From the current development perspective, the aluminum alloy battery casing solution has a promising prospect for lightweighting. The comprehensive application cost of aluminum alloy battery shell is low, the performance meets the requirements, and it can achieve the integration of the circulating water channel of water-cooled batteries. The automobile power battery pack is made of aluminum material, which has the characteristics of easy processing and molding, high temperature corrosion resistance, good heat transfer and conductivity, long service life, flame retardancy, anti-aging performance, explosion-proof performance, etc. Three different types of aluminum materials, namely rolled aluminum plates, extruded aluminum profiles, and cast
