According to our (Global Info Research) latest study, the global Aluminum Calendering Processing market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The aluminum rolling processing industry is the process of producing various aluminum materials from electrolytic aluminum (mainly aluminum) through various processes and processes such as casting, rolling or extrusion, and surface treatment. According to different processing techniques, aluminum materials can be divided into aluminum rolled materials and aluminum extruded materials, which together account for more than 95% of the output of aluminum processed materials. Among them, aluminum rolled products generally refer to aluminum plates, aluminum strips, aluminum foils, and aluminum extrusions generally refer to aluminum profiles, aluminum wires, aluminum pipes and other products.

The upstream of the aluminum rolling processing industry is the electrolytic aluminum industry, and the downstream application fields are extensive. The aluminum rolling processing industry purchases aluminum ingots from electrolytic aluminum companies to process and produce aluminum sheets, strips and foils. Among them, in the field of transportation, aluminum strips are used to manufacture automotive heat exchangers, automotive body panels, automotive interior and exterior decoration materials, ship decks, aircraft fuselage aluminum panels, and other spare parts panels; thick and thin are used as device materials for vehicles and other transportation tools; lithium batteries The positive current collector belongs to the thickness category of single zero foil and

double zero foil, which is called battery foil.
