Abstracts

'Cookware consists of different types of pots and pans that are used for specific purposes. Aluminum cookware refers to cookware made of Aluminum material, usually with cast Aluminum or Anodized aluminium.

Aluminum cookware is fairly inexpensive in comparison to cookware made from other materials. Aluminum is lightweight but fairly strong. It is a good conductor of heat and does not easily distort when exposed to high temperatures. Aluminum works well for sauteing and frying foods because of its heat responsiveness. The drawback of aluminum is that it reacts to acidic and alkaline foods, causing it to corrode and affect the taste of the food being cook. Aluminum is generally used as a core heat conductor, or coated with stainless steel or an anodized coating to protect the food.'

Scope of the Report:

This report focuses on the Aluminum Cookware in Global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

Market Segment by Manufacturers, this report covers

SEB

Alluflon

Illa SpA
