Abstracts

The global Aluminum-free Baking Powder market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Aluminum-free baking powder is a leavening agent that does not contain aluminum and is often used in baking instead of traditional baking powder. Traditional baking powder usually contains sodium bicarbonate (baking soda), acidic ingredients (such as yogurt powder or acid salts) and aluminum salts (such as calcium aluminum phosphate), while aluminum-free baking powder has these aluminum salts removed. Aluminum salts are commonly used as stabilizers and thickeners in traditional baking powder, but some people are concerned that excessive aluminum intake may have negative health effects. Therefore, some people choose to use aluminum-free baking powder as a healthier alternative. Aluminum-free baking powder usually uses aluminum-free acidic ingredients, such as citric acid or acetic acid, to replace the aluminum salt ingredients in traditional baking powder. It can still act as a leavening agent during the baking process, making food such as dough or cakes rise and become soft. When using aluminum-free baking powder, the dosage should be adjusted according to the corresponding recipe to ensure the desired texture and taste of baked goods.

This report studies the global Aluminum-free Baking Powder production, demand, key manufacturers, and key regions.
