## Abstracts

The global Aluminum Magnesium Scandium Alloy (AlMgSc) market size is expected to reach \$ 46.51 million by 2032, rising at a market growth of 5.8% CAGR during the forecast period (2026-2032).

In 2025, global AlMgSc Alloy production reached approximately 589 tons, with an average global market price of around US\$52 per kilogram. Aluminum magnesium scandium alloy (AlMgSc) is a new type of high-performance alloy material made of metal aluminum as the base material, metal magnesium as the main added element, and a trace amount of metal scandium.

The global market for Aluminum Magnesium Scandium (AlMgSc) alloy is currently in an early, technology-driven stage of development. Its exceptional strength-to-weight ratio and corrosion resistance position it as a critical material for lightweighting in aerospace and high-end automotive sectors. The development trend is clearly pointing towards deep integration with additive manufacturing (3D printing) technology, which is unlocking the potential for manufacturing complex, high-performance components and serves as a core driver for market expansion. Growth opportunities primarily stem from global decarbonization pressures, the proliferation of electric vehicles, and the relentless pursuit of fuel efficiency, collectively generating strong demand for lightweight advanced materials. However, a major obstacle for the industry lies in its fragile supply chain. The supply of scandium, the key raw material, is chronically unstable and costly, largely because it is typically obtained as a by-product of other mining activities. This constrains flexible output increases and causes cost volatility, directly hindering the alloy's large-scale commercial adoption.

This report studies the global Aluminum Magnesium Scandium Alloy (AlMgSc) production, demand, key manufacturers, and key regions.
