Abstracts

According to our (Global Info Research) latest study, the global Aluminum Oxyhydroxide market size was valued at US\$ 1583 million in 2025 and is forecast to a readjusted size of US\$ 2330 million by 2032 with a CAGR of 5.7% during review period.

Aluminum oxyhydroxide refers to a group of aluminum oxide hydroxide minerals (commonly including boehmite, diaspore, and related phases) with the general formula $\text{AlO}(\text{OH})$, widely used as a precursor for alumina, catalysts, adsorbents, flame retardants, and advanced ceramics. Its supply chain begins upstream with bauxite mining (the primary aluminum ore), followed by refining via the Bayer process to produce alumina hydrates, which are then further processed (controlled precipitation, hydrothermal synthesis, or calcination/rehydration routes) into specific aluminum oxyhydroxide phases with tailored particle size, surface area, and purity. Midstream activities include purification, milling, surface modification, and classification to meet application-specific requirements (e.g., nano-boehmite for lithium-ion battery separators or high-surface-area grades for catalysts). Downstream, these materials are supplied to industries such as petrochemicals (catalyst supports), electronics (ceramics and coatings), energy storage, flame-retardant fillers in polymers, and environmental applications (adsorbents and water treatment), with distribution handled through both direct manufacturer supply and specialty chemical distributors. In 2025, global Aluminum Oxyhydroxide output was about 2.6 million tons with 3.4 million tons of capacity, average prices of USD 500-1,200 per ton, and gross margins around 24%.
