Abstracts

Aluminum is a metal that is not found separately in the earth's crust. It is extracted from alumina, which is found abundantly in the earth's crust. Alumina is then transformed to aluminum through various electrolytic processes. Aluminum has the advantage of being easily recyclable, corrosion resistant, lightweight, and also energy efficient. Pure aluminum or aluminum mixed with other alloys such as copper, magnesium, and silicon are used for various industrial purposes. Aluminum sheets and plates are of flat rolled product types that are used in the Packaging, Transportation, and Construction industries because of their advantages, such as being relatively light weight and corrosion resistant.
