Aluminum rod is the most commonly used deoxidizer in modern steelmaking and production. The main functions of the aluminum wire in the steel are: to calm the molten steel, prevent the generation of bubbles when the molten steel solidifies; form dispersed AlN particles, fix the nitrogen in the steel, control the austenite grain size when the steel is reheated, and increase the grain size. Coarsening temperature, reducing the overheating sensitivity and hardenability of steel, improving the welding performance of steel; inhibiting the aging characteristics of low carbon steel; reducing the notch sensitivity and ductile-brittle transition temperature of steel, etc.
