The global Aluminum Substrate Strip market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Aluminum substrate strip is a special metal substrate material, consisting of an aluminum substrate and other functional layers. It has excellent thermal conductivity, electromagnetic shielding performance and mechanical properties, and is widely used in electronics, electrical, optoelectronics and other fields. The main features of aluminum substrate strips include:

1. Excellent thermal conductivity: Aluminum substrate has good thermal conductivity, can effectively dissipate heat, and is suitable for the heat dissipation requirements of high-power electronic devices.
2. Excellent electromagnetic shielding performance: Aluminum substrate strip can provide good electromagnetic shielding effect, which can effectively block external electromagnetic interference and protect the normal operation of electronic devices.
3. Lightweight and high strength: Compared with traditional fiberglass substrates or ceramic substrates, aluminum substrate strips are lighter in weight and higher in strength, which is beneficial to reducing the weight and volume of the overall equipment.
4. Good processing performance: Aluminum substrate strips can be cut, drilled, stamped, etc. through conventional metal processing methods to facilitate the manufacture of electronic devices of various shapes and sizes. Aluminum substrate strips are widely used in LED lighting, power modules, automotive electronics, electronic communications and other fields, and can meet the heat dissipation and electromagnetic shielding needs of high-power electronic devices.
