According to our (Global Info Research) latest study, the global Amateur Radio Repeater market size was valued at US\$ 473 million in 2024 and is forecast to a readjusted size of USD 682 million by 2031 with a CAGR of 5.4% during review period.

An amateur radio repeater is a device designed for amateur radio enthusiasts to extend the communication range, enhance signal strength, and achieve cross-regional communication. It overcomes terrain obstacles, distance limitations, and signal attenuation by receiving, amplifying, and retransmitting radio signals, making communications more reliable and efficient. The repeater captures weak signals in amateur radio bands (such as VHF/UHF) through a directional antenna. The received signal is enhanced by a low-noise amplifier (LNA) and decoded and filtered by a processor. The amplified signal is enhanced by a high-power amplifier (HPA) and radiated to the target area by the transmitting antenna. Amateur repeaters must use frequency bands allocated by the International Telecommunication Union (ITU) or national radio management agencies. For example, in China, amateur repeaters usually use 144–146 MHz (VHF) and 430–440 MHz (UHF).
