Abstracts

AMB is an evolution of DBC technology in which AgCu solder containing the active elements Ti and Zr is wetted and reacted at the interface between ceramic and metal at a high temperature of around 800°C, thus achieving heterogeneous bonding between ceramic and metal. Compared to conventional DBC substrates, ceramic laminates prepared using the AMB process not only have higher thermal conductivity and better copper layer bonding, but also have the advantages of lower thermal resistance and higher reliability.
