## Abstracts

According to our (Global Info Research) latest study, the global Ambient Temperature Gel Permeation Chromatography(GPC) Systems market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Gel Permeation Chromatography (GPC) is a chromatographic technique used for the separation and analysis of polymers and macromolecules based on their size. Ambient temperature GPC refers to conducting GPC analysis at room temperature or a temperature that is not significantly different from the laboratory ambient temperature.

In GPC, a column is packed with porous particles or gels with a specific pore size distribution. The sample containing polymers or macromolecules is dissolved in a suitable solvent and then injected into the column. As the sample travels through the column, smaller molecules can enter the pores of the gel, leading to longer retention times, while larger molecules cannot penetrate the pores and elute earlier.
