Abstracts

According to our (Global Info Research) latest study, the global Americium-242 market size was valued at USD 17 million in 2023 and is forecast to a readjusted size of USD 28 million by 2030 with a CAGR of 6.9% during review period.

Americium was first produced in 1944 by the group of Glenn T. Seaborg from Berkeley, California, at the Metallurgical Laboratory of the University of Chicago, as part of the Manhattan Project. Although it is the third element in the transuranic series, it was discovered fourth, after the heavier curium. The discovery was kept secret and only released to the public in November 1945. Most americium is produced by uranium or plutonium being bombarded with neutrons in nuclear reactors – one tonne of spent nuclear fuel contains about 100 grams of americium. It is widely used in commercial ionization chamber smoke detectors, as well as in neutron sources and industrial gauges. Several unusual applications, such as nuclear batteries or fuel for space ships with nuclear propulsion, have been proposed for the isotope ^{242}mAm , but they are as yet hindered by the scarcity and high price of this nuclear isomer.
