Abstracts

The global Aminoethylaminopropyltrimethoxysilane market size is expected to reach \$ 598 million by 2032, rising at a market growth of 4.3% CAGR during the forecast period (2026-2032).

Aminoethylaminopropyltrimethoxysilane (CAS 1760-24-3) is a transparent, colorless oily liquid. It enhances adhesion, mechanical strength, and electric properties, especially when materials are wetted. This silane improves performance in epoxy, phenolic, and trimeric cyanamide resins, as well as in polyester, polypropylene, polyethylene, polyamide, polycarbonate, and PVC. It also acts as a glass fiber lubricant and is widely used for fillers like glass beads, carbon black, talc, mica, and clay. In 2025, global Aminoethylaminopropyltrimethoxysilane production reached approximately 33.67 K MT, with an average global market price of around US\$ 12,856 per MT.

Aminoethylaminopropyltrimethoxysilane belongs to the functional subdivision products of amino silane coupling agents, with a relatively limited market size but stable demand, presenting the overall characteristics of 'application driven and technology oriented'. Its demand mainly comes from the performance upgrade of the coatings and adhesives industry, as well as the requirement for improving the interfacial bonding strength of composite materials, which have strong functional irreplaceability.

From the perspective of competitive landscape, the industry is dominated by enterprises with the ability to synthesize and formulate organic silicon. Product differences are mainly reflected in purity control, impurity levels, and application adaptability. The high-end market has a high concentration, while the competition in the mid to low-end market is relatively sufficient.

From the perspective of development trends, on the one hand, downstream high-performance materials such as electronic packaging and advanced composite materials are driving the development of products towards high purity and specialization; On the other hand, the tightening of environmental regulations has led to an increase in demand for water-based systems and low VOC formulations, further enhancing the application value of this type of silane. Overall, this product belongs to the category of typical fine chemical additives, with short-term growth synchronized with downstream material industries. In the medium to long term, it will maintain steady growth driven by the development of high-end manufacturing and new materials.
