According to our (Global Info Research) latest study, the global Ammonia Hydrogen Fuel Cells market size was valued at US\$ 236 million in 2024 and is forecast to a readjusted size of USD 538 million by 2031 with a CAGR of 13.5% during review period.

The working principle of ammonia-hydrogen fuel cells is based on the catalytic decomposition of ammonia and the electrochemical oxidation of hydrogen. In a fuel cell, ammonia is first cracked into hydrogen and nitrogen by heating, and then the hydrogen undergoes an oxidation reaction at the anode, releasing electrons that are transferred to the cathode through an external circuit, while generating protons. At the cathode, protons combine with oxygen to generate water, while consuming electrons transferred from the anode. The electrical energy generated in this process can be used to drive various devices.
