Abstracts

The global Ammonio Methacrylate Copolymer market size is expected to reach \$ 54.13 million by 2032, rising at a market growth of 5.0% CAGR during the forecast period (2026-2032).

Ammonio Methacrylate Copolymer is a cationic polymer formed through the copolymerization of methacrylate and quaternary ammonium salt monomers. It serves as a pharmaceutical excipient and is widely utilized as a coating material and matrix former in sustained- and controlled-release drug formulations; furthermore, due to its positive charge, it exhibits excellent film-forming capabilities and antimicrobial properties.

Key upstream raw materials include methyl methacrylate, ethyl acrylate, and specialized monomers containing quaternary ammonium groups; these monomers are predominantly derived from the downstream processing products of large-scale petrochemical enterprises. Midstream manufacturers employ bulk polymerization or solution polymerization techniques to strictly control the proportion of quaternary ammonium groups within the polymer chain (typically around 10% for Type A and 5% for Type B). Downstream applications primarily target the pharmaceutical industry, specifically sustained- and controlled-release drug delivery systems. Additionally, certain high-end personal care products represent another significant area of application for this material.

The market price for Ammonio Methacrylate Copolymer powder typically ranges from \$45 to \$73 per kilogram, while aqueous dispersions are priced at approximately \$18 to \$30 per kilogram. The industry's gross profit margin hovers around 30%.
