Abstracts

According to our (Global Info Research) latest study, the global Ammonium Dimolybdate (ADM) market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Ammonium dimolybdate (ADM) is the inorganic compound with the formula $(\text{NH}_4)_2\text{Mo}_2\text{O}_7$. It is a white, water-soluble solid. ADM is an intermediate in the production of molybdenum compounds from its ores.

ADM is an intermediate in the production of molybdenum compounds from its ores. Roasting typical ore produces crude molybdenum(VI) oxides, which can be extracted into aqueous ammonia, affording ammonium molybdate. Heating solutions of ammonium molybdate gives ADM. Upon heating, solid ammonium dimolybdate decomposes to molybdenum trioxide.

In terms of its chemical structure, the anion is a polymeric consisting of distorted octahedral Mo centers linked by tetrahedral molybdate centers. When prepared in the absence of water as its tetrabutylammonium salt, dimolybdate adopts the centrosymmetric structure observed for dichromate.
