According to our (Global Info Research) latest study, the global Ammonium Hexachloroiridate(IV) market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Ammonium hexachloroiridate(IV) is an iridium complex, usually in the form of hexachloroiridate ion. It has important applications in catalysis, analytical chemistry and materials science. The synthesis of ammonium chloroiridate usually involves the reaction of iridium salts with ammonium chloride to form a stable iridium complex. In catalysis, ammonium chloroiridate is widely used in a variety of chemical reactions due to its excellent catalytic properties. For example, it exhibits good catalytic activity in hydrogenation reactions, oxidation reactions and cross-coupling reactions in organic synthesis. In addition, due to the high catalytic efficiency of iridium metal, ammonium chloroiridate is also used to promote some complex reaction processes to improve the selectivity and yield of the reaction. In analytical chemistry, ammonium chloroiridate is used as an analytical reagent and catalyst to help researchers conduct qualitative and quantitative analysis of substances. Its unique chemical properties make it potentially applicable in the detection and analysis of metal ions. In materials science, ammonium chloroiridate can be used as a precursor to prepare iridium-based nanomaterials and films. These materials show broad application prospects in electronic devices, catalysts and sensors. By adjusting the synthesis conditions, researchers can control their structure and properties, and then develop new functional materials.
