## Abstracts

Amorphous Graphite is very fine flake graphite. It has a soft black earthy appearance with crystal sizes of less than 40µm and a high ash content. Amorphous graphite is formed by the metamorphism of anthracite coal seams that may be hosted by quartzites, phyllites, metagreywackes and metaconglomerates. It is primarily used for lubricant products. It is the least graphitic with the lowest carbon purity of the three graphite forms.
