According to our (Global Info Research) latest study, the global Amorphous Nanocrystalline Magnetic Cores market size was valued at US\$ 971 million in 2025 and is forecast to a readjusted size of US\$ 1712 million by 2032 with a CAGR of 8.6% during review period.

Amorphous nanocrystalline magnetic cores are high-performance soft magnetic components manufactured from amorphous or nanocrystalline alloy ribbons through rapid solidification, controlled annealing, and core forming processes. Their microstructure is characterized by either a fully amorphous atomic arrangement or nanometer-sized crystalline grains embedded in an amorphous matrix, resulting in high permeability, low coercivity, low core loss, relatively high saturation flux density, and excellent medium- to high-frequency magnetic performance. These cores enable efficient and low-loss operation across a wide frequency and temperature range and are widely used in distribution transformers, reactors, current transformers, switching power supplies, inverters, renewable energy systems, and power electronics.

The market for amorphous nanocrystalline magnetic cores is driven by global demand for energy efficiency improvement and carbon emission reduction, which is increasing the adoption of low-loss and high-efficiency magnetic materials in power systems, industrial equipment, and renewable energy applications. As power electronics penetration, renewable energy integration, and trends toward higher frequency and higher power density accelerate, the performance limitations of conventional silicon steel become more evident, supporting wider use of amorphous and nanocrystalline cores in transformers, reactors, and power conversion equipment. In addition, stricter energy efficiency regulations, grid modernization initiatives, and rapid growth in electric

vehicles, charging infrastructure, and energy storage systems are continuously expanding the addressable market for these advanced magnetic core materials.
