According to our (Global Info Research) latest study, the global Amphoteric Fluorosurfactant market size was valued at USD 538.1 million in 2023 and is forecast to a readjusted size of USD 660.3 million by 2030 with a CAGR of 3.0% during review period.

Fluorosurfactant is a surfactant with a fluorocarbon chain as a non-polar group, that is, a fluorine atom partially or completely replaces the hydrogen atoms on the hydrocarbon chain. Fluorocarbon surfactants have high surface activity, high thermodynamic and chemical stability.

Fluorosurfactant can realize low surface tension with smaller adding amount as compared with generally used hydrocarbon surfactants or silicone surfactants. In other words, this is a surfactant that has a low critical micelle concentration and a low critical surface tension.

These characteristics are derived from the following facts: the atomic radius of the fluorine atom is slightly larger than that of the hydrogen atom; and a high electronegativity of the fluorine atom enables the formation of a strong carbon-fluorine bond thereby forming the perfluoroalkyl group having weak intermolecular force and small interaction with other substances.
