## Abstracts

The global Amplitude Comparator market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

An amplitude comparator is an electronic circuit component that compares the amplitude of two input signals and outputs a logic signal or level corresponding to the result of the comparison. Amplitude comparators typically have two inputs and one output. The input end receives the signal to be compared, and the output end generates a corresponding logic signal or level according to the comparison result. The output signal of the comparator usually has two states, such as high level and low level, logic 1 and logic 0, switch on and switch off, etc., depending on the design and working conditions of the comparator. Amplitude comparators are often used in applications such as voltage comparison, current comparison, and power comparison. Its working principle is based on comparing the amplitude of the input signal, and judging whether the input signal is greater than, less than or equal to the comparison threshold according to the set comparison threshold (Threshold). The output signal of the comparator can be used to trigger the actions of other circuits, such as switches, alarms, control signals, etc. Amplitude comparators are widely used in electronic circuits and systems, including analog circuits and digital circuits. In analog circuits, amplitude comparators are often used for signal amplification, discrimination and processing, such as in circuits such as amplifiers, filters, and sensor interfaces. In digital circuits, amplitude comparators are often used in applications such as logic gates, analog-to-digital converters, and analog-to-digital converters.
