## Abstracts

According to our (Global Info Research) latest study, the global Analog Modulator market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

An Analog Modulator is a device used to convert an analog signal into a carrier signal. It combines a low-frequency signal (i.e. baseband signal) with a high-frequency carrier signal to generate a new composite signal characterized by a frequency band in the frequency range around the carrier frequency. This new composite signal can be transmitted by radio or cable, etc., and is used for broadcasting, television, voice communication and other applications of analog signals.
