The global Analog Modulator market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

An Analog Modulator is a device used to convert an analog signal into a carrier signal. It combines a low-frequency signal (i.e. baseband signal) with a high-frequency carrier signal to generate a new composite signal characterized by a frequency band in the frequency range around the carrier frequency. This new composite signal can be transmitted by radio or cable, etc., and is used for broadcasting, television, voice communication and other applications of analog signals.
