## Abstracts

According to our (Global Info Research) latest study, the global Analog Tuner market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The function of the analog tuner is to receive the high frequency signal of the analog TV, and perform channel selection, high frequency signal amplification and frequency conversion processing. In addition, an intermediate frequency amplifier and a high frequency signal demodulator are added. Analog high-frequency head Analog high-frequency signal reception, amplification, demodulation and other circuits need to be strictly adjusted to meet the requirements of the whole machine, so it is difficult to complete high-frequency signal reception, amplification, demodulation and other functions by the high-frequency head , so the main task of the analog tuner is to select the channel, and the other task is to reduce the frequency of the received high-frequency signal to a fixed frequency. This fixed frequency signal is the intermediate frequency signal, and its frequency is generally 38MHz.
