Abstracts

The global Analog Tuner market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The function of the analog tuner is to receive the high frequency signal of the analog TV, and perform channel selection, high frequency signal amplification and frequency conversion processing. In addition, an intermediate frequency amplifier and a high frequency signal demodulator are added. Analog high-frequency head Analog high-frequency signal reception, amplification, demodulation and other circuits need to be strictly adjusted to meet the requirements of the whole machine, so it is difficult to complete high-frequency signal reception, amplification, demodulation and other functions by the high-frequency head , so the main task of the analog tuner is to select the channel, and the other task is to reduce the frequency of the received high-frequency signal to a fixed frequency. This fixed frequency signal is the intermediate frequency signal, and its frequency is generally 38MHz.

This report studies the global Analog Tuner production, demand, key manufacturers, and key regions.
