According to our (Global Info Research) latest study, the global Analytical Gel Permeation Chromatography(GPC) Systems market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Analytical Gel Permeation Chromatography System is a technique used to separate and analyze polymers or macromolecules based on their molecular size and molecular weight distribution. GPC is commonly used to determine the molecular weight, molecular weight distribution, and other characteristics of polymeric materials.

In GPC, a sample solution containing the polymer molecules is injected into the system. The sample solution then passes through a column filled with a porous gel stationary phase, typically composed of cross-linked styrene-divinylbenzene or silica particles. Larger molecules cannot penetrate the small pores of the gel and, as a result, move through the column more quickly, while smaller molecules can enter the pores and move more slowly. This separation is achieved based on the principle of size exclusion, where the larger molecules elute first, followed by smaller ones. GPC is widely used in polymer science, materials science, and chemical research to characterize a wide range of macromolecules, including synthetic polymers, biopolymers, proteins, and even

nanoparticles. It provides valuable information for quality control, research and development, and structure-property relationships in polymer-based materials.
