Abstracts

The anastomosis assist device is an ancillary device for proximal anastomosis in off-pump coronary artery bypass grafting (OPCAB). This device is used in cases where it is difficult to clamp vascular graft partially, as it is short. To overcome such complications, anastomosis assist devices are used by physicians worldwide. The major advantage of this device is that it facilitates the anastomosis of arterial side branches to the artificial graft by eliminating the use of partial clamp on the artificial conduits and by providing a plane surface for easy handling for suture.
