Abstracts

Anchor rod is the most basic part of the roadway support in contemporary coal mine, it strengthens the surrounding rock of the roadway together, so that the surrounding rock itself supports itself. Anchor is not only used in mines, but also used in engineering technology to reinforce the main body of slopes, tunnels and dams. Anchor rod is a tensile member which goes deep into the stratum, one end of the anchor bolt is connected with the engineering structure, and the other end goes deep into the stratum. The whole anchor rod is divided into a free section and an anchoring section. The free section is the area where the tensile force of the anchor bolt head is transmitted to the anchoring body, and its function is to apply prestress to the anchor rod.
