Abstracts

The global Anesthesia Mask for Neonatus market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Anesthesia Mask for Neonatus consists of a mask body, a fixed ring clip, a one-way valve, and a mask bag. The neonatal anesthesia mask can cover the patient's mouth and nose, and is connected to the anesthesia machine through the anesthesia pipeline to provide the patient with an effective non-invasive breathing circuit. In clinical practice, the anesthesia mask has two main functions; 1: It is used for oxygen supply, for example, before the implementation of intravenous general anesthesia intubation, the mask will be used to cover the patient's mouth and nose, allowing the patient to inhale high-flow pure oxygen, that is, pre-oxygenation, increases the oxygen content in the patient's lungs, and provides sufficient time for general anesthesia and intubation. In addition, in a short operation, after the patient is given intravenous anesthesia, the patient can be given oxygen with a mask to assist the patient to breathe spontaneously. When the patient has difficulty in breathing and other emergencies, the mask can be used to give the patient pressurized oxygen, establish a temporary artificial breathing channel, and buy time for the patient to be rescued; 2. Use the mask to administer anesthesia, and when the patient needs to be inhaled During general anesthesia, the mask is used to cover the patient's mouth and nose, allowing high concentrations of oxygen and anesthetics to enter the body through the patient's breathing, so as to achieve the purpose of anesthesia administration.
