The global Anesthetic Gas Vaporizer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The basic principle of the anesthesia vaporizer is to use the changes in the temperature and heat source of the surrounding environment to turn the anesthetic drug into vaporized gas, and through a certain amount of carrier gas, part of the gas will carry away the saturated anesthetic gas and become an anesthetic vapor with a certain concentration. Air flow, directly into the anesthesia circuit. According to the different types of dosing, it is generally divided into 5 kinds of evaporators with different medicines, namely: enflurane, isoflurane, sevoflurane, desflurane, and halothane.
