According to our (Global Info Research) latest study, the global Angle Beam Transducer market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

An angle beam transducer is a device that converts one form of energy into another form of energy at an angle to the incident energy. It is commonly used for ultrasonic testing, emitting and receiving ultrasonic waves at specific angles, which is useful for detecting sub-surface defects in materials. The transducer consists of a piezoelectric crystal or magnetostrictive material that vibrates when an electric current is present, producing ultrasonic waves that travel through the material being measured. By adjusting the angle of the transducer, the depth and location of defects can be determined more precisely.
