An angled spotting scope is an optical instrument that is often used to observe distant objects, especially in bird watching, hunting, nature observation, and shooting sports. Unlike traditional straight-view telescopes, the eyepiece of an angled telescope is at a certain angle (usually 45 degrees) relative to the tube body. The angled design reduces the pressure on the neck and back and is suitable for use during long-term observation. This makes the user more comfortable when observing, especially suitable for observation while sitting or standing, and is also convenient for use with a tripod to increase stability.
