Abstracts

Animal biotechnology refers to the branch of biotechnology, which deals with the molecular biology techniques for producing genetically engineered animals (whose genome are modified), in order to make them suitable for pharmaceutical, industrial or agricultural applications. The genetically modified animals have improved growth rates, synthesized therapeutic proteins, and are resistant to various diseases. Increasing R&D by the major market players, rising regulatory approvals, and the rising focus toward cloning and transgenic animals are contributing to the market growth. However, high cost of research and development, and the ethical issues associated with animal biotechnology products may adversely affect the market growth.

According to our (Global Info Research) latest study, the global Animal Biotechnology market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.
