Abstracts

Animal Genetics is a branch of genetics that studies heredity and variation chiefly in farm animals but also in domestic and wild animals. It is based on general genetic principles and concepts, and it mainly uses the hybrid, cytological, population, ontogenetic, mathematical-statistical, and twin methods of general genetics.

Animal breeding or genetics is the area of science where experts are trying to steer the frequency of certain genes by combining the most superior or desired individual animals to be the parents of the next generation. This process is focused on getting improved offspring who are on average better than the previous generation.
