Abstracts

The global Animal Growth Promoter market size is expected to reach \$ 14710 million by 2032, rising at a market growth of 3.6% CAGR during the forecast period (2026-2032).

Animal growth promoters are substances used to enhance the growth rate, feed efficiency, and overall production performance of animals. The product range of growth promoters mainly includes hormones, antibiotics, beta-agonists, and enzymes. These substances work on various physiological mechanisms within the animal's body, thereby accelerating the growth process or improving their health condition. Common animal growth promoters include growth hormones, feed antibiotics, and lean meat hormones.

1. **Hormonal Substances:** Such as growth hormones (e.g., recombinant bovine growth hormone), which help improve the growth rate and muscle mass of animals.
2. **Antibiotics:** Used to enhance immunity, reduce disease occurrence, and indirectly improve growth efficiency.
3. **Beta-Agonists:** Such as clenbuterol, which promote fat breakdown in the animal's body, reduce fat accumulation, and increase lean meat proportion.
4. **Enzyme Preparations:** These help improve the digestive absorption ability of animals, enhancing feed utilization and indirectly promoting growth.

Animal growth promoters are widely used in the livestock industry, especially in the farming of poultry, pigs, and cattle. Their main function is to increase production efficiency and reduce feeding costs. However, with the growing consumer health

awareness and concerns about food safety, the use of animal growth promoters has come under increasing scrutiny and regulation.

The market for animal growth promoters is experiencing significant growth opportunities due to factors such as the increasing global population and rising demand for high-quality animal protein. Below are some key drivers and trends:

1. Market Development Opportunities and Key Drivers:

Global Food Demand Growth: The increase in global population has led to a rise in the demand for animal protein, which in turn boosts the consumption of meat and dairy products, driving the expansion of the animal growth promoter market.

Need for Improved Farming Efficiency: The livestock industry is under pressure to improve efficiency and reduce costs, and the use of animal growth promoters can help enhance productivity with limited resources.

Technological Advancements: With the continuous development of genetic engineering and biotechnology, new growth promoters and more precise feed additives are emerging, further driving market growth.

2. Market Risks:

Antibiotic Resistance: The use of antibiotics as growth promoters can lead to the development of antibiotic resistance, which poses a risk to public health. Many countries have implemented stricter regulations on antibiotic use.

Consumer Health and Food Safety Concerns: Consumers are cautious about the safety and potential health impacts of growth promoters (especially hormones and antibiotics), which may influence market demand.

3. Market Concentration: The market for animal growth promoters is relatively concentrated, with a few large chemical and biotechnology companies dominating the sector. These companies have strong competitive advantages in terms of technology development, product innovation, and market promotion.

4. Downstream Demand Trends:

Demand for Meat and Dairy Products: As the middle class grows and the demand for

high-protein foods increases, the demand for meat and dairy products continues to rise, directly driving the demand for animal growth promoters.

Growing Demand for Natural and Additive-Free Products: More consumers are choosing products that are free from antibiotics and hormones, which impacts the use of growth promoters in the market and has led to the development of natural alternatives.

5. Latest Technologies:

Gene Editing Technologies: Technologies like CRISPR are being used to develop more targeted growth promoters or technologies that enhance animal immunity.

Biological Feed Additives: As environmental and health concerns rise, the application of biological feed additives (such as probiotics and enzymes) is increasing, presenting potential alternatives to traditional chemical growth promoters.
