Abstracts

Almost all the organic acids used in animal nutrition, such as formic, propionic, lactic, acetic, sorbic or citric acids have an aliphatic structure and represent a source of energy for the cells. Benzoic acid, instead, is built on an aromatic ring and has different metabolic and absorption characteristics. The main mode of action of organic acids is through their antimicrobial effects, the magnitude of which is dependent on the chemical properties of the individual acid or acid salt. Dietary organic acids act as antimicrobials in the feed and thus improve the feed's hygienic quality.

Organic acids are capable to reduce pH in feed. In addition, organic acids have the ability to cross the cell membranes of bacteria. And once inside the cell they will dissociate and disturb metabolism.

As a result, proliferation of the bacteria is reduced, resulting in lower pathogen counts in the intestinal tract. With the combination of these two modes of action of organic acids, growth of pathogenic bacteria in the feed can be reduced, therefore reduces digestive disturbances in the intestinal tract.

Organic acids have been used in commercial compound feeds, mostly for feed preservation, and its application to diets for poultry and pigs.
