Anodic electrophoretic coating is a water-soluble resin, a polymer carboxylic acid amine (ammonium) salt, exists in the state of ion and molecular balance in the water, under the action of direct current electric field, ions will produce directional movement, anions move to the anode and release electrons on the anode and attach to the anode, this process is called electrodeposition. The anodic electrophoretic coating is mainly based on acrylic anodic electrophoretic paint. The film-forming polymer used in anodic electrophoretic coating is anionic resin, and the commonly used polymer is polycarboxyl. The neutralizing agent is organic amine and inorganic base, such as KOH, monoethanolamine, triethanolamine, triethylamine and other anodic electrophoretic coatings dissociate into anionic polymer in water.
