Anti-cavitation control valve? is a control valve that can effectively avoid cavitation phenomena. Cavitation is a form of material destruction when the pressure and temperature of the liquid reach or exceed critical values, which can cause damage to the valve's mechanical structure and produce serious noise. Anti-cavitation control valves can effectively suppress the occurrence of cavitation under high-pressure differential conditions by reasonably distributing medium pressure and determining throttling areas at all levels, thereby protecting the valve from damage and improving the service life and reliability of the valve.
