According to our (Global Info Research) latest study, the global Anti-Embolism Socks market size was valued at US\$ 43.1 million in 2024 and is forecast to a readjusted size of USD 57.4 million by 2031 with a CAGR of 3.3% during review period.

Anti-embolism socks, also known as compression stockings or graduated compression stockings, are specialized elastic garments designed to improve blood circulation in the legs. They apply graduated pressure, meaning the pressure is strongest at the ankle and gradually decreases towards the knee and thigh. This graduated compression helps to promote venous blood flow back to the heart, preventing blood from pooling in the legs and reducing the risk of deep vein thrombosis (DVT), a serious condition involving blood clots. They are commonly used after surgery, during prolonged periods of inactivity (such as long flights or bed rest), and for individuals with venous insufficiency.

The anti-embolism sock industry is evolving with a focus on improved comfort, efficacy, and accessibility. One significant trend is the development of more comfortable and breathable materials, such as microfiber blends and moisture-wicking fabrics, to enhance patient compliance and reduce skin irritation. There's also a growing emphasis on personalized compression levels, with manufacturers offering a wider range of sizes and compression gradients to better suit individual patient needs and anatomical variations. This includes specialized sizing for different body types and limb shapes. Another trend is the integration of advanced knitting technologies, allowing for seamless designs that minimize pressure points and improve overall comfort. Furthermore, there's a growing focus on incorporating features like antimicrobial treatments to reduce the risk of infection and odor control. The market is also seeing a rise in the availability of

fashionable and discreet designs, moving away from the traditional clinical appearance to encourage greater patient acceptance and adherence. Finally, there's an increasing availability of over-the-counter options for preventative use, making anti-embolism socks more accessible to a wider population. These trends collectively aim to improve patient comfort, increase adherence to compression therapy, and ultimately reduce the incidence of DVT and other venous disorders.
