Anti-Motion Sickness Glasses is a wearable device designed based on the principle of neural perception regulation. Its core function is to alleviate motion sickness caused by information conflict between the vestibular system and the visual system through optical and spatial perception intervention. The device uses a lens-free ring frame with a built-in liquid or mechanical dynamic balance system (such as liquid level sensor, gyroscope array). It simulates gravity and motion trajectory in real time to generate visual feedback signals synchronized with the semicircular canal perception of the human inner ear, thereby eliminating the information contradiction between the visual and vestibular systems. Its mechanism of action is similar to 'Sensory Recalibration' in cognitive neuroscience. It reconstructs the balance state of multisensory integration through non-drug means. The typical effective time is within 5-15 minutes. It is suitable for the prevention of motion sickness in scenes such as riding, sailing, and virtual reality.
