Abstracts

The global Anti-Seize Thread Lubricant market size is expected to reach \$ 309 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032).

Anti-seize thread lubricant is a type of functional lubricating and isolating material coated on the surface of threaded connections. It is primarily used to prevent metal from seizing, sintering, or rusting under high temperature, high pressure, corrosive conditions, or long-term static conditions.

In 2025, the global price of anti-seize thread lubricant was \$5045 per ton, with sales of 42,000 tons. The average annual production capacity per line was approximately 1200 tons, and the industry profit margin was 18-20%.

Upstream and Downstream Industry Chain

Upstream: Basic lubricants, thickeners, metal powders (copper, nickel, aluminum), graphite and ceramic fillers, corrosion inhibitors, and packaging materials. Downstream: Oil and gas equipment and pipeline engineering, chemical and refining plants, power and nuclear power, shipbuilding and marine engineering, mining machinery, iron and steel metallurgy, wind power, and heavy equipment manufacturing enterprises. End users are typically concentrated in: equipment maintenance departments, repair contractors, EPC engineering companies, and industrial MRO systems.

Actual Procurement Logic

In actual procurement, anti-jamming thread lubricants are no longer just 'minor accessories included with equipment,' but are selected based on failure risks: high-temperature disassembly failure leading to maintenance delays; electrochemical corrosion between different metals resulting in thread failure; unstable torque causing assembly consistency issues; and incorrect use of copper/nickel-containing systems leading to compliance and material conflict risks.

Technology and Product Trends

Current upgrades of anti-jamming thread lubricants focus on four aspects: higher temperature resistance and wider operating condition coverage, reducing SKU complexity; metal-free/low-metal systems to meet environmental protection and special material requirements; torque control and assembly consistency optimization, reducing assembly risks; and convenient packaging and use (brush application, spraying, quantitative spot application). The shift from 'jamming prevention' to 'assembly management tool' is becoming a new direction for product positioning.

Future Outlook

Anti-jamming thread lubricants are transforming from neglected consumables into an integral part of equipment reliability throughout its entire lifecycle. In industries with high-value equipment, high safety requirements, and high downtime costs, it is no longer just about 'applying a little for smoother operation,' but a low-cost, quantifiable risk hedging strategy.
